The recombinant \*\*virus\*\* can also be preserved in a purified form. More specifically, prior to the addition of the formulation buffer, the crude recombinant \*\*virus\*\* described above may be clarified by passing it through a filter and then concentrated, such as by a cross flow concentrating system (Filtron Technology Corp., Nortborough, Mass.). Within one embodiment, \*\*DNasc\*\* is added to the concentrate to digest exogenous DNA. The digest is then \*\*diafiltrated\*\* in order to remove excess media components and to establish the recombinant \*\*virus\*\* in a more desirable buffered solution. The \*\*diafiltrate\*\* is then passed over a Sephadex S-500 gel column and a purified recombinant \*\*virus\*\* is eluate in order to reach a desired final concentration of this eluate in order to reach a desired final concentration of the constituents and to minimally dilute the recombinant \*\*virus\*\*. The aqueous suspension may then be stored, preferably at -70.degree. C., or immediately dried. As above, the formulation buffer may.
